Introduction

We present a Finite Element (FE) scheme for the numerical approximation of the solution to the following non-local equation:

Fractional Poisson equation

$$(-d_x^2)^s u = f, \quad x \in (-L, L), \qquad u \equiv 0, \quad x \in \mathbb{R} \setminus (-L, L).$$

As a natural application, we analyze the numerical control problem for the following parabolic equation:

Fractional heat equation

$$\begin{cases} z_t + (-d_x^2)^s z = g \mathbf{1}_\omega, & (x,t) \in (-1,1) \times (0,T) \\ z = 0, & (x,t) \in [\mathbb{R} \setminus (-1,1)] \times (0,T) \\ z(x,0) = z_0(x), & x \in (-1,1) \end{cases}$$

Introduction

We present a Finite Element (FE) scheme for the numerical approximation of the solution to the following non-local equation:

Fractional Poisson equation

$$(-d_x^2)^s u = f, \quad x \in (-L, L), \qquad u \equiv 0, \quad x \in \mathbb{R} \setminus (-L, L)$$

As a natural application, we analyze the numerical control problem for the following parabolic equation:

Fractional heat equation

$$\begin{cases} z_t + (-d_x^2)^s z = g \mathbf{1}_{\omega}, & (x,t) \in (-1,1) \times (0,T) \\ z = 0, & (x,t) \in [\mathbb{R} \setminus (-1,1)] \times (0,T) \\ z(x,0) = z_0(x), & x \in (-1,1) \end{cases}$$

Fractional Laplacian

For any function *u* sufficiently regular and for any $s \in (0, 1)$, the s-th power of the Laplace operator is given by

$$(-d_x^2)^s u(x) = C_s P.V. \int_{\mathbb{R}} \frac{u(x) - u(y)}{|x - y|^{1 + 2s}} dy.$$

Functional setting: fractional Sobolev spaces

•
$$H^{s}(-L,L) := \left\{ u \in L^{2}(-L,L) : \frac{|u(x)-u(y)|}{|x-y|^{\frac{1}{2}+s}} \in L^{2}((-L,L)^{2}) \right\}.$$

• $||u||_{H^{s}(-L,L)} := \left(\int_{-L}^{L} |u|^{2} dx + \int_{-L}^{L} \int_{-L}^{L} \frac{|u(x)-u(y)|^{2}}{|x-y|^{1+2s}} dx dy \right)^{\frac{1}{2}}.$
• $H^{s}_{0}(-L,L) := \left\{ u \in H^{s}(\mathbb{R}) : u = 0 \text{ in } \mathbb{R} \setminus (-L,L) \right\}.$

Existing literature

Variational formulation for the elliptic problem

Find $u \in H_0^s(-L, L)$ such that

$$\underbrace{\frac{c_{1,s}}{2}\int_{\mathbb{R}}\int_{\mathbb{R}}\frac{(u(x)-u(y))(v(x)-v(y))}{|x-y|^{1+2s}}\,dxdy}_{a(u,v)}=\int_{-L}^{L}fv\,dx,$$

for all $v \in H_0^s(-L, L)$.

Well posedness

 $a(\cdot, \cdot) : H_0^s(-L, L) \times H_0^s(-L, L) \to \mathbb{R}$ continuous and coercive

If $f \in H^{-s}(-L, L)$, then there \Rightarrow exists a unique weak solution $u \in H_0^s(-L, L)$.

Elliptic problem Parabolic problem

Control results

Fractional heat equation

$$\begin{cases} z_t + (-d_x^2)^s z = g \mathbf{1}_{\omega}, & (x,t) \in (-1,1) \times (0,T) \\ z = 0, & (x,t) \in [\mathbb{R} \setminus (-1,1)] \times (0,T) \\ z(x,0) = z_0(x), & x \in (-1,1) \end{cases}$$

Proposition

For all $z_0 \in L^2(-1, 1)$ and T > 0, the equation is null-controllable with a control function $g \in L^2(\omega \times (0, T))$ if and only if s > 1/2.

Proposition

Let $s \in (0, 1)$ and T > 0. For all $z_0 \in L^2(-1, 1)$, there exists a control function $g \in L^2(\omega \times (0, T))$ such that the unique solution z to the fractional Heat equation is approximately controllable.

Elliptic problem Parabolic problem

Proof of the null controllability (sketch)

The result is equivalent to the existence of a constant C > 0 such that the following observability inequality holds

$$\|\varphi(x,0)\|_{L^2(-1,1)}^2 \leq C \int_0^T \left|\int_\omega \varphi(x,t)g(x,t)\,dx\right|^2\,dt,$$

where $\varphi(x, t)$ is the unique solution to the adjoint system

$$\begin{cases} -\varphi_t + (-d_x^2)^s \varphi = 0, \quad (x,t) \in (-1,1) \times (0,T) \\ \varphi = 0, \qquad \qquad (x,t) \in [\mathbb{R} \setminus (-1,1)] \times (0,T) \\ \varphi(x,T) = \varphi^T(x), \qquad x \in (-1,1). \end{cases}$$

▲ 四→
 12/45

Elliptic problem Parabolic problem

Spectral expansion

$$\varphi(\mathbf{x},t) = \sum_{k\geq 1} \varphi_k \mathbf{e}^{-\lambda_k(T-t)} \varrho_k(\mathbf{x}), \quad \varphi_k = \langle \varphi^T, \varrho_k \rangle.$$

The observability inequality becomes

$$\sum_{k\geq 1} |\varphi_k|^2 e^{-2\lambda_k T} \leq C \int_0^T \left| \sum_{k\geq 1} \varphi_k g_k(t) e^{-\lambda_k t} \right|^2 dt, \quad g_k = \langle g \mathbf{1}_{\omega}, \varrho_k \rangle.$$

▲ 四 →
 13/45

Elliptic problem Parabolic problem

Müntz Theorem: the last inequality is true if and only if

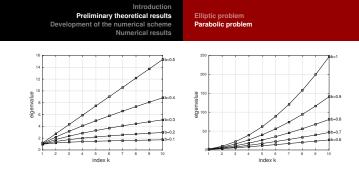

$$\sum_{k\geq 1}\frac{1}{\lambda_k}<+\infty.$$

Eigenvalues of $(-d_x^2)^s$ on (-1, 1) with DBC¹

$$\lambda_k = \left(rac{k\pi}{2} - rac{(1-s)\pi}{4}
ight)^{2s} + O\left(rac{1}{k}
ight).$$

The series is convergent if and only if s > 1/2. Therefore, the observability inequality holds when s > 1/2, but it is false when $s \le 1/2$.

¹ M. Kwaśnichi, J. Funct. Anal., 2012

First ten eigenvalues of $(-d_x^2)^s$ on (-1, 1) with DBC for $s \le 1/2$ (left) and s > 1/2 (right).

- $s \le 1/2$: the equation is not null-controllable.
- s > 1/2: the equation is null-controllable.

Elliptic problem Parabolic problem

Proof of the approximate controllability (sketch)

The result follows from the following property.

Parabolic unique continuation

Given $s \in (0, 1)$ and $\varphi_0^T \in L^2(-1, 1)$, let φ be the unique solution to the adjoint equation. Let $\omega \subset (-1, 1)$ be an arbitrary open set. If $\varphi = 0$ on $\omega \times (0, T)$, then $\varphi = 0$ on $(-1, 1) \times (0, T)$.

This, in turn, is a consequence of the Unique Continuation property for the Fractional Laplacian, obtained by Fall and Felli².

Elliptic problem Parabolic problem

Finite element approximation of the elliptic problem

Partition of (-L, L)

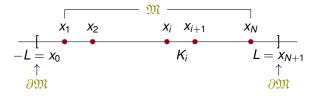

$$-L = x_0 < x_1 < \ldots < x_i < x_{i+1} < \ldots < x_{N+1} = L,$$

$$x_{i+1} = x_i + h, \ i = 0, \ldots N.$$

•
$$\mathfrak{M} := \{ x_i : i = 1, \dots, N \}.$$

•
$$\partial \mathfrak{M} := \{x_0, x_{N+1}\}.$$

•
$$K_i := [x_i, x_{i+1}].$$

Elliptic problem Parabolic problem

Consider the discrete space

$$V_h := \Big\{ v \in H^s_0(-L,L) \, \big| \ v |_{K_i} \in \mathcal{P}^1 \Big\},$$

where \mathcal{P}^{1} is the space of the continuous and piece-wise linear functions.

Discrete variational formulation

Find $u_h \in V_h$ such that

$$\frac{c_{1,s}}{2} \int_{\mathbb{R}} \int_{\mathbb{R}} \frac{(u_h(x) - u_h(y))(v_h(x) - v_h(y))}{|x - y|^{1 + 2s}} \, dx dy = \int_{-L}^{L} f v_h \, dx,$$

for all $v_h \in V_h$.

4 ☐ ►
 20/45

Elliptic problem Parabolic problem

Given $\{\phi_i\}_{i=1}^N$ any basis of V_h , it is sufficient that the discrete variational formulation is satisfied for

$$u_h(x) = \sum_{j=1}^N u_j \phi_j(x), \quad v_h(x) = \phi_j(x)$$

In this way, we are reduced to solve the linear system $A_h u = F$

• $\mathcal{A}_h \in \mathbb{R}^{N \times N}$: stiffness matrix with components

$$a_{i,j} = \frac{c_{1,s}}{2} \int_{\mathbb{R}} \int_{\mathbb{R}} \frac{(\phi_i(x) - \phi_i(y))(\phi_j(x) - \phi_j(y))}{|x - y|^{1+2s}} \, dx dy,$$

• $F \in \mathbb{R}^N$ given by $F = (F_1, \dots, F_N)$ with

$$F_i = \langle f, \phi_i \rangle = \int_{-L}^{L} f \phi_i \, d\mathbf{x}, \quad i = 1, \dots, N.$$

Basis functions

We employ the classical basis $\{\phi_i\}_{i=1}^N$ in which each ϕ_i is the tent function with $supp(\phi_i) = (x_{i-1}, x_{i+1})$ and verifying $\phi_i(x_j) = \delta_{i,j}$.

$$\phi_i(x) = 1 - \frac{|x - x_i|}{h}$$

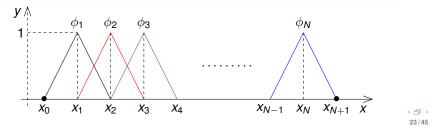

4 ☐ ► 22/45

Construction of the stiffness matrix

Remark

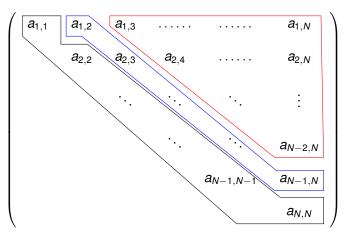

- A_h is symmetric. Therefore, in our algorithm we will only need to compute the values a_{i,j} with j ≥ i.
- Due to the non-local nature of the problem, the matrix A_h is full.
- While computing the values a_{i,j}, we will only work on the mesh m, not considering the points of the set ∂m. In this way, we will ensure that the basis functions φ_i satisfy the zero Dirichlet boundary conditions.

Elliptic problem Parabolic problem

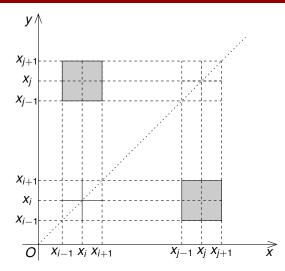

The building of the stiffness matrix \mathcal{A}_h is done it in three steps

- **1** We fill the upper triangle, corresponding to $j \ge i + 2$.
- **2** We fill the upper diagonal corresponding to j = i + 1.
- 3 We fill the diagonal.

Elliptic problem Parabolic problem

Penalized Hilbert Uniqueness Method

We have to solve the following minimization problem: find

$$\varphi_{\varepsilon}^{\mathsf{T}} = \min_{\varphi \in L^2(-1,1)} J_{\varepsilon}(\varphi^{\mathsf{T}})$$

where

$$J_{\varepsilon}(\varphi^{\mathsf{T}}) := \frac{1}{2} \int_0^{\mathsf{T}} \int_{\omega} |\varphi|^2 \, dx dt + \frac{\varepsilon}{2} \left\| \varphi^{\mathsf{T}} \right\|_{L^2(-1,1)}^2 + \int_{\Omega} z_0 \varphi(0) \, dx$$

and where φ is the solution to the adjoint problem

$$\begin{cases} -\varphi_t + (-d_x^2)^s \varphi = 0, & (x,t) \in (-1,1) \times (0,T) \\ \varphi = 0, & (x,t) \in \left[\mathbb{R} \setminus (-1,1) \right] \times (0,T) \\ \varphi(x,T) = \varphi^T(x), & x \in (-1,1). \end{cases}$$

Elliptic problem Parabolic problem

The approximate and null controllability properties of the system, for a given initial datum z_0 , can be expressed in terms of the behavior of the penalized HUM approach. In particular, we have:

Theorem (F. Boyer, ESAIM: PROCEEDINGS, 2013)

The equation is approximately controllable at time T from the initial datum z₀ if and only if

$$\varphi_{\varepsilon}^{\mathsf{T}} \to \mathsf{0}, \quad as \ \varepsilon \to \mathsf{0}.$$

The equation is null-controllable at time T from the initial datum z₀ if and only if

$$M_{z_0}^2 := 2 \sup_{\varepsilon > 0} \left(\inf_{L^2(0,T;L^2(\omega))} J_{\varepsilon} \right) < +\infty.$$

In this case, we have

$$\|\boldsymbol{g}\|_{L^{2}(0,T;L^{2}(\omega))} \leq \boldsymbol{M}_{z_{0}}, \quad \left\|\boldsymbol{\varphi}_{\varepsilon}^{T}\right\|_{L^{2}(-L,L)} \leq \boldsymbol{M}_{z_{0}}\sqrt{\varepsilon}.$$

Control experiments

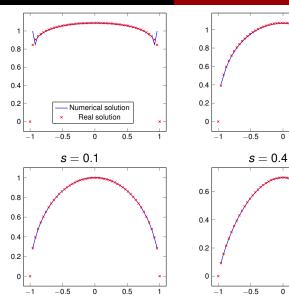

In order to test numerically the accuracy of our method, we use the following problem

$$\begin{cases} (-d_x^2)^s u = 1, & x \in (-L, L) \\ u \equiv 0, & x \in \mathbb{R} \setminus (-L, L). \end{cases}$$

In this particular case, the solution can be computed exactly and it reads as follows,

Solution

$$u(x)=\frac{2^{-2s}\sqrt{\pi}}{\Gamma\left(\frac{1+2s}{2}\right)\Gamma(1+s)}\left(L^2-x^2\right)^s.$$

Error analysis

The computation of the error in the space $H_0^s(-L, L)$ can be readily done by using the definition of the bilinear form, namely

$$\|u-u_h\|_{H^s_0(-L,L)}^2 = a(u-u_h, u-u_h) = \int_{-L}^{L} f(x) (u(x)-u_h(x)) dx.$$

$$f \equiv 1 \Rightarrow \|u - u_h\|_{H^s_0(-L,L)} = \left(\int_{-L}^{L} (u(x) - u_h(x)) dx\right)^{1/2}$$

The right-hand side can be easily computed, since we have the closed formula

$$\int_{-L}^{L} u \, dx = \frac{\pi L^{2s+1}}{2^{2s} \Gamma(s+\frac{1}{2}) \Gamma(s+\frac{3}{2})}$$

and the term corresponding to $\int_{-L}^{L} u_h$ can be carried out numerically.

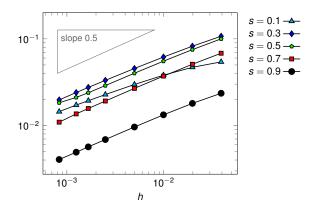

Theorem (G. Acosta and J.P. Borthagaray, SIAM J. Numer. Anal., 2017)

For the solution u of the elliptic problem and its FE approximation u_h , if h is sufficiently small, the following estimates hold

$$\begin{split} \|u - u_h\|_{H_0^s(-L,L)} &\leq Ch^{1/2} |\ln h| \, \|f\|_{C^{\frac{1}{2}-s}(-L,L)}, & \text{if } s < 1/2, \\ \|u - u_h\|_{H_0^s(-L,L)} &\leq Ch^{1/2} |\ln h| \, \|f\|_{L^{\infty}(-L,L)}, & \text{if } s = 1/2, \\ \|u - u_h\|_{H_0^s(-L,L)} &\leq \frac{C}{2s-1} h^{1/2} \sqrt{|\ln h|} \, \|f\|_{C^{\beta}(-L,L)}, & \text{if } s > 1/2, \end{split}$$

where C is a positive constant not depending on h.

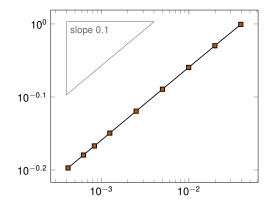

Control experiments

The convergence rate is maintained also for small values of *s*. This confirms that the behavior obtained for s = 0.1 is not in contrast with the known theoretical results. Indeed, since it is well-known that the notion of trace is not defined for the spaces $H^s(-L, L)$ with $s \le 1/2$, it is somehow natural that we cannot expect a point-wise convergence in this case.

Control experiments

As a further validation of this fact, we plot the behavior of the L^{∞} -norm of the difference between the real and the numerical solution to the fractional Poisson equation.

Increasing the number of point of discretization, the L^{∞} -norm is decreasing with a rate (in *h*) of 0.1.

Control experiments

Controllability of the fractional heat equation

■ We use the finite-element approximation of (-d_x²)^s for the space discretization and the implicit Euler scheme in the time variable.

$$\begin{cases} \mathcal{M}_h \frac{z^{n+1} - z^n}{\delta t} + \mathcal{A}_h z^{n+1} = \mathbf{1}_\omega v_h^{n+1}, & \forall n \in \{1, \dots, M-1\}\\ z^0 = z_0 \end{cases}$$

- We choose the penalization term ε as a function of *h*.
- PRACTICAL RULE: choose $\varepsilon \sim h^{2p}$ where *p* is the order of accuracy in space of the numerical method used for the discretization of the spatial operator involved. (in this case, we take p = 1/2).

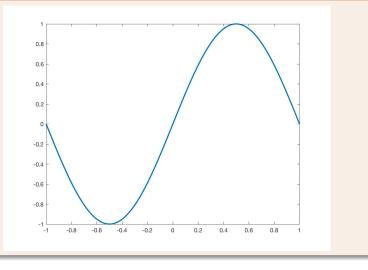

Control experiments

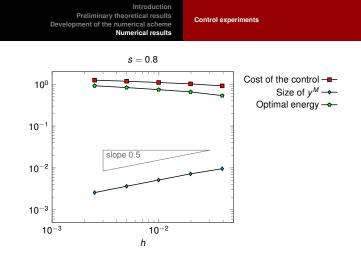

Control experiments

Uncontrolled solution - s = 0.8, T = 0.2 s

Control experiments

Controlled solution - s = 0.8, T = 0.2 s, $\omega = (-0.3, 0.8)$

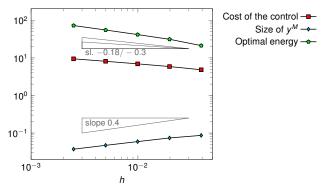

For s = 0.8 we observe that:

The control cost and the optimal energy remain bounded as $h \rightarrow 0$.

$$| y^M |_{L^2(\mathbb{R}^m)} \sim C\sqrt{\phi(h)} = Ch^{1/2}.$$

This confirms that the system is null controllable.

s = 0.5

Control experiments

For s = 0.5 we observe that:

The control cost and the optimal energy do not remain bounded as *h* → 0.

$$|\mathbf{y}^{M}|_{L^{2}(\mathbb{R}^{\mathfrak{M}})} \sim Ch^{0.4}.$$

This confirms that the system is only approximately controllable.
