Outline of this talk: LDA → GGA → MGGA

- Static DFT: From *Local Density Approximation* (LDA) ... through *Generalized Gradient Approximation* (GGA) ... to *Meta-GGA* (MGGA);
- Adiabatic TDDFT of optical response: LDA and GGA fail, MGGA succeeds;
- Results and discussion.

Hierarchy of approximations in static DFT

Electron density

$$n_0(\mathbf{r}) = \sum_{\alpha \in occ} |\psi_{\alpha}(\mathbf{r})|^2.$$

- LDA : $E_{xc} = \int \varepsilon_{xc}[n_0(\mathbf{r})] d\mathbf{r}$: local;
- GGA : $E_{xc} = \int \varepsilon_{xc}[n_0(\mathbf{r}), \nabla n_0(\mathbf{r})] d\mathbf{r}$: semi-local;
- MGGA: $E_{xc} = \int \varepsilon_{xc}[n_0(\mathbf{r}), \nabla n_0(\mathbf{r}), \tau(\mathbf{r})] d\mathbf{r}$: non-local.

where

$$\tau(\mathbf{r}) = \frac{1}{2} \sum_{\alpha \in occ} |\nabla \psi_{\alpha}(\mathbf{r})|^2$$

is the density of *kinetic energy*.

Time-dependent linear response (RPA)

$$n(\mathbf{r}, t) = n_0(\mathbf{r}) + n_1(\mathbf{r}, t) + \dots \quad (1)$$

$$n_1(\mathbf{r}, t) = \int \chi_s(\mathbf{r}, \mathbf{r}', t - t') v_{eff}(\mathbf{r}', t') d\mathbf{r}' dt', \quad (2)$$

RPA: $v_{eff}(\mathbf{r}, t) = v_{ext}(\mathbf{r}, t) + \int \frac{n_0(\mathbf{r}', t)}{|\mathbf{r}' - \mathbf{r}|} d\mathbf{r}'.$ (3)

$$\chi_s(\mathbf{r}, \mathbf{r}', \omega) = \sum_{\alpha\beta} \frac{f_\alpha - f_\beta}{\omega - \epsilon_\beta + \epsilon_\alpha + i\eta} \psi_\alpha^*(\mathbf{r}) \psi_\beta(\mathbf{r}) \psi_\beta^*(\mathbf{r}') \psi_\alpha(\mathbf{r}') \quad (4)$$

- Lindhard's independent-particles response function.

DF of semiconductors from static DFT (LDA RPA)

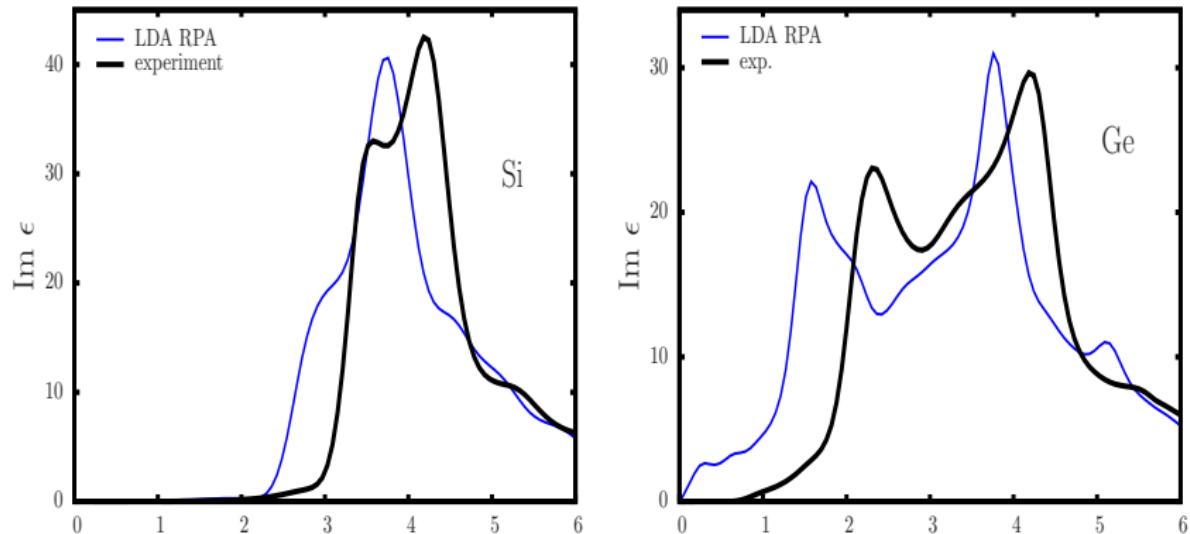

Fig.1: Dielectric function of crystalline Si and Ge (LDA RPA).

DF of semiconductors from static DFT (MGGA RPA)

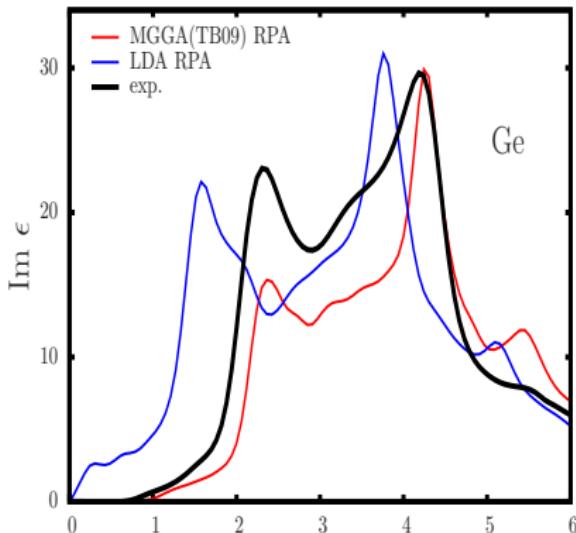

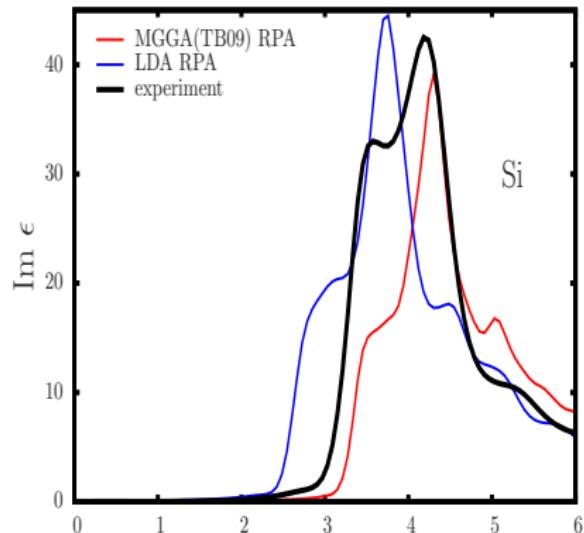

Fig.2: Dielectric function of crystalline Si and Ge (MGGA RPA).

The best achievable with RPA ($f_{xc} = 0$)!

Time-dependent density functional theory (TDDFT)

TD Kohn-Sham equations:

$$i \frac{\partial}{\partial t} \psi_\alpha(\mathbf{r}, t) = \left[-\frac{1}{2} \Delta + v_{eff}(\mathbf{r}, t) \right] \psi_\alpha(\mathbf{r}, t), \quad (5)$$

$$v_{eff}(\mathbf{r}, t) = v_{ext}(\mathbf{r}, t) + \int \frac{n_0(\mathbf{r}', t)}{|\mathbf{r}' - \mathbf{r}|} d\mathbf{r}' + \text{v}_{xc}(\mathbf{r}, t). \quad (6)$$

In variance with RPA .

Time-dependent linear response (TDDFT)

$$n(\mathbf{r}, t) = n_0(\mathbf{r}) + n_1(\mathbf{r}, t) + \dots, \quad (7)$$

$$n_1(\mathbf{r}, t) = \int \chi(\mathbf{r}, \mathbf{r}', t - t') v_{ext}(\mathbf{r}', t') d\mathbf{r}' dt'. \quad (8)$$

Interacting particles response function (unknown).

$$n_1(\mathbf{r}, t) = \int \chi_s(\mathbf{r}, \mathbf{r}', t - t') v_{eff}(\mathbf{r}', t') d\mathbf{r}' dt', \quad (9)$$

Lindhard's independent particles response function of Eq. (4).

The concept of the exchange-correlation kernel f_{xc}

$$f_{xc}(\mathbf{r}, \mathbf{r}', \omega) = \frac{\delta v_{xc}(\mathbf{r}, \omega)}{\delta n_1(\mathbf{r}', \omega)}, \quad (10)$$

$$\chi^{-1}(\mathbf{r}, \mathbf{r}', \omega) = \chi_s^{-1}(\mathbf{r}, \mathbf{r}', \omega) - \frac{e^2}{|\mathbf{r} - \mathbf{r}'|} - f_{xc}(\mathbf{r}, \mathbf{r}', \omega).$$

- $f_{xc}(\mathbf{r}, \mathbf{r}', \omega) = 0$: RPA;
- $f_{xc}(\mathbf{r}, \mathbf{r}', \omega) = f_{xc}(\mathbf{r}, \mathbf{r}', \omega = 0)$: Adiabatic TDDFT:
 - Adiabatic LDA: $f_{xc}(\mathbf{r}, \mathbf{r}') = \frac{\delta^2 E_{xc}^{LDA}}{\delta n(\mathbf{r}) \delta n(\mathbf{r}')} = \frac{d^2 E_{xc}^h(n)}{dn^2} \Big|_{n=n_0(\mathbf{r})} \delta(\mathbf{r} - \mathbf{r}');$
 - Adiabatic MGGA: $f_{xc}(\mathbf{r}, \mathbf{r}') = \frac{\delta^2 E_{xc}^{MGGA}}{\delta n(\mathbf{r}) \delta n(\mathbf{r}')}$.

$$\widehat{E}_{xc} = \int \varepsilon_{xc}[n_0(\mathbf{r}), \nabla n_0(\mathbf{r}), \tau(\mathbf{r})] d\mathbf{r}, \quad (11)$$

$$\begin{aligned} \widehat{v}_{xc}(\mathbf{r}) &= \frac{\delta E_{xc}}{\delta n(\mathbf{r})} = \frac{\partial \varepsilon_{xc}}{\partial n}(\mathbf{r}) - \nabla \frac{\partial \varepsilon_{xc}}{\partial \nabla n}(\mathbf{r}) \\ &\quad + \int \frac{\partial \varepsilon_{xc}}{\partial \tau}(\mathbf{r}') \frac{\delta \tau(\mathbf{r}')}{\delta n(\mathbf{r})} d\mathbf{r}'. \end{aligned} \quad (12)$$

$$\begin{aligned}
& \textcircled{f_{xc}(\mathbf{r}, \mathbf{r}')} = \frac{\delta^2 E_{xc}}{\delta n(\mathbf{r}) \delta n(\mathbf{r}')} \\
&= \frac{\partial^2 \varepsilon_{xc}}{\partial n^2}(\mathbf{r}) \delta(\mathbf{r} - \mathbf{r}') - \left[\nabla \frac{\partial^2 \varepsilon_{xc}}{\partial n \partial \nabla n}(\mathbf{r}) \right] \delta(\mathbf{r} - \mathbf{r}') - \nabla_i \frac{\partial^2 \varepsilon_{xc}}{\partial \nabla_i n \partial \nabla_j n}(\mathbf{r}) \nabla_j \delta(\mathbf{r} - \mathbf{r}') \\
&+ \frac{\partial^2 \varepsilon_{xc}}{\partial n \partial \tau}(\mathbf{r}) \frac{\delta \tau(\mathbf{r})}{\delta n(\mathbf{r}')} + \frac{\partial^2 \varepsilon_{xc}}{\partial n \partial \tau}(\mathbf{r}') \frac{\delta \tau(\mathbf{r}')}{\delta n(\mathbf{r})} \\
&- \nabla \frac{\partial^2 \varepsilon_{xc}}{\partial \nabla n \partial \tau}(\mathbf{r}) \frac{\delta \tau(\mathbf{r})}{\delta n(\mathbf{r}')} - \nabla' \frac{\partial^2 \varepsilon_{xc}}{\partial \nabla' n \partial \tau}(\mathbf{r}') \frac{\delta \tau(\mathbf{r}')}{\delta n(\mathbf{r})} + \int \frac{\partial^2 \varepsilon_{xc}}{\partial \tau^2}(\mathbf{r}'') \frac{\delta \tau(\mathbf{r}'')}{\delta n(\mathbf{r})} \frac{\delta \tau(\mathbf{r}'')}{\delta n(\mathbf{r}')} d\mathbf{r}'' \\
&+ \int \frac{\partial \varepsilon_{xc}}{\partial \tau}(\mathbf{r}'') \frac{\delta^2 \tau(\mathbf{r}'')}{\delta n(\mathbf{r}) \delta n(\mathbf{r}')} d\mathbf{r}'',
\end{aligned} \tag{13}$$

which is the ‘exact’ adiabatic MGGA f_{xc} .

Cardinal approximation

We proceed by introducing a very crude approximation

$$\boxed{\frac{\partial \epsilon_{xc}}{\partial \tau}(\mathbf{r}) \approx \text{const} = \overline{\frac{\partial \epsilon_{xc}}{\partial \tau}(\mathbf{r})}} \quad (14)$$

Then $v_{xc}(\mathbf{r}) \approx \frac{\partial \epsilon_{xc}}{\partial n}(\mathbf{r}) - \nabla \frac{\partial \epsilon_{xc}}{\partial \nabla n}(\mathbf{r}) + \overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \int \frac{\delta \tau(\mathbf{r}')}{\delta n(\mathbf{r}')} d\mathbf{r}'$. (15)

Using $\int \frac{\delta \tau(\mathbf{r}')}{\delta n(\mathbf{r}')} d\mathbf{r}' = -v_s(\mathbf{r})$, (16)

and $\chi_s^{-1}(\mathbf{r}, \mathbf{r}') = \frac{\delta v_s(\mathbf{r})}{\delta n(\mathbf{r}')}$,

and omitting all non-singular terms, we arrive at

$$\boxed{f_{xc}(\mathbf{r}, \mathbf{r}') \approx -\overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \chi_s^{-1}(\mathbf{r}, \mathbf{r}')} \quad (17)$$

Ultra-nonlocality of f_{xc} in optical limit

Since

$$\epsilon(\mathbf{q}, \omega) = 1 - \frac{4\pi}{q^2} \frac{\chi_s(\mathbf{q}, \omega)}{1 - \chi_s(\mathbf{q}, \omega) f_{xc}(\mathbf{q}, \omega)}, \text{ and } \chi_s(\mathbf{q}, \omega) \xrightarrow[\mathbf{q} \rightarrow \mathbf{0}]{} \text{const} \times q^2, \quad (18)$$

we need

$$f_{xc}(\mathbf{q}, \omega) \xrightarrow[\mathbf{q} \rightarrow \mathbf{0}]{} \frac{\alpha}{q^2}, \text{ with } \alpha \neq 0. \quad (19)$$

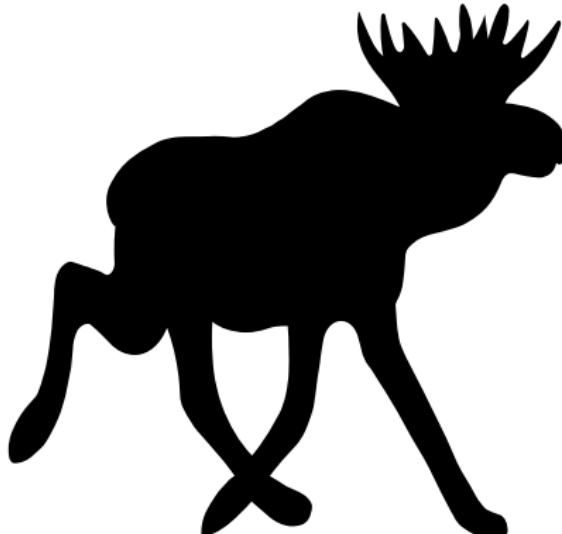

The diagram consists of two curved arrows. One arrow points from the text "True for MGGA!" to the equation $f_{xc}(\mathbf{q}) \approx -\overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \chi_s^{-1}(\mathbf{q})$. The other arrow points from the text "Wrong for LDA & GGA" to the equation $\alpha = -\overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \lim_{\mathbf{q} \rightarrow \mathbf{0}} q^2 \chi_s^{-1}(\mathbf{q})$.

True for MGGA!
Wrong for LDA & GGA

Main approximation to Eq. (13)

$$f_{xc}(\mathbf{q}) \approx -\overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \chi_s^{-1}(\mathbf{q}), \quad (20)$$
$$\alpha = -\overline{\frac{\partial \epsilon_{xc}}{\partial \tau}} \lim_{\mathbf{q} \rightarrow \mathbf{0}} q^2 \chi_s^{-1}(\mathbf{q}). \quad (21)$$

Details of calculations

The Elk FP-LAPW Code

<http://elk.sourceforge.net/>

The Elk FP-LAPW Code

An all-electron full-potential linearised augmented-plane wave (FP-LAPW) code with many advanced features. Written originally at [Karlsruhe Institute of Technology](#) as a milestone of the EXCITING EU Research and Training Network, the code is designed to be as simple as possible so that new developments in the field of density functional theory can be added quickly and reliably. The code is freely available under the [GNU General Public License](#).

Latest version: 1.3.31

[News](#) | [Features](#) | [Download](#) | [Documentation](#) | [FAQ](#) | [Forums](#) | [Mailing list](#) | [Contributions](#) | [Wiki](#) | [CECAM tutorial](#) | [Links](#)

Features

General

- High precision all-electron DFT code
- FP-LAPW basis with local-orbitals
- APW radial derivative matching to arbitrary orders at muffin-tin surface (super-LAPW, etc.)
- Large number of local-orbitals allowed (all core states can be made valence for example)
- Every element in the periodic table available
- Total energies resolved into components
- Full treatment of spin-orbit coupling
- Core states treated with the radial Dirac equation
- Simple to use: just one input file required with all input parameters optional
- Multiple tasks can be run consecutively

Structure and symmetry

- Determination of lattice and crystal symmetry groups from input lattice and coordinate files
- Determination of atomic coordinates from space group data (with the Spacegroup utility)
- XCrysDen and V-Sim file output
- Transformation of unit cell conventional to primitive unit cell
- Automatic determination of muffin-tin radii
- Full symmetrisation of density and magnetisation and their conjugate fields
- Automatic determination and reduction of the \mathbf{k} -point set

Magnetism

Fig.3: The Elk FP-LAPW code (<http://elk.sourceforge.net>) was used with our implementation of meta-GGA.

Choice of MGGA xc functional

Two xc functionals VS98 (Voorhis & Scuseria, 1998) and TPSS (Tao, Perdew, Staroverov, & Scuseria, 2003) have been tried.

	VS98			TPSS		
	$\overline{\partial\epsilon_x/\partial\tau}$	$\overline{\partial\epsilon_c/\partial\tau}$	$\overline{\partial\epsilon_{xc}/\partial\tau}$	$\overline{\partial\epsilon_x/\partial\tau}$	$\overline{\partial\epsilon_c/\partial\tau}$	$\overline{\partial\epsilon_{xc}/\partial\tau}$
Si	0.122	-0.226	-0.104	4.60×10^{-3}	-1.15×10^{-4}	4.49×10^{-3}
Ge	0.135	-0.241	-0.106	2.94×10^{-3}	8.73×10^{-5}	3.03×10^{-3}

- We have developed the adiabatic kinetic energy dependent (MGGA) TDDFT;
- Contrary to LDA and GGA, MGGA xc kernel f_{xc} exhibits the singularity of the type α/q^2 , which is important to describe the excitonic effect in crystals;
- Our calculations for a number of the diamond-structure and zinc blende semiconductors demonstrate the high promise of the MGGA-based xc functionals as a new tool in the arsenal of TDDFT methods.
