Outline

- 1 Introduction
- 2 Well Posedness
- 3 Asymptotic stability
- 4 Polynomial Energy decay
- 5 Optimality of the energy decay rate
- 6 Example

Motivation.

$$\begin{cases} y_{tt}(x, t) - c^2 \Delta y(x, t) = 0 & , x \in \Omega, t > 0, \\ m(x)\delta_{tt}(x, t) + d(x)\delta_t(x, t) + k(x)\delta(x, t) = -\rho y_t(x, t) & , x \in \partial\Omega, t > 0, \\ \frac{\partial y}{\partial \nu}(x, t) = \delta_t(x, t) & , x \in \partial\Omega, t > 0, \end{cases}$$

- Existence and Uniqueness of solution in appropriate space.
- Strong stability of the solution.
- Non Uniform Stability.

The acoustic boundary condition was first introduced in

 J.T. Beale ,S.I. Rosencrans

Acoustic boundary conditions.

Bull. Amer.Math., Vol 80 (1974), pp. 1276-1278.

Motivation.

$$\begin{cases} y_{tt}(x, t) - c^2 \Delta y(x, t) = 0 & , x \in \Omega, t > 0, \\ y(x, t) = 0 & , x \in \Gamma_1, t > 0, \\ m(x)\delta_{tt}(x, t) + d(x)\delta_t(x, t) + k(x)\delta(x, t) = -\rho y_t(x, t) & , x \in \Gamma_0, t > 0, \\ \frac{\partial y}{\partial \nu}(x, t) = \delta_t(x, t) & , x \in \Gamma_0, t > 0, \end{cases}$$

Polynomial stability:

$$E(t) \leq \frac{1}{t}(E(t) + E_1(t)),$$

optimality wasn't discussed.

Method: Introducing a Lyaponouv functional.

J.E. Munoz Rivera, Y. Qin.

Polynomial decay for the energy with an acoustic boundary condition.

Appl. Math.Lett., Vol 16 No. 2 (2003), pp. 249-256.

Motivation

What is the kind of energy decay of the generalization of that system?

$$\begin{cases} y_{tt}(x, t) - y_{xx}(x, t) &= 0, \quad 0 < x < 1, t > 0, \\ y(0, t) &= 0, \quad t > 0, \\ y_x(1, t) + (\eta(t), C)_{\mathbb{C}^n} &= 0, \quad t > 0, \\ \eta_t(t) - B\eta(t) - Cy_t(1, t) &= 0, \quad t > 0, \end{cases} \quad (1)$$

with the following initial conditions:

$$\begin{cases} y(x, 0) = y_0(x), y_t(x, 0) = y_1(x), \quad 0 < x < 1, \\ \eta(0) = \eta_0, \end{cases} \quad (2)$$

- $C \in \mathbb{C}^n$ and $B \in M_n(\mathbb{C})$ such that $\Re(B \cdot, \cdot) \leq 0$.

Cauchy problem

Consider the energy space

$$\mathcal{H} = V \times L^2(0, 1) \times \mathbb{C}^n,$$

endowed with the inner product

$$((y, z, \eta), (y_1, z_1, \eta_1))_{\mathcal{H}} = \int_0^1 y_x \bar{y}_1 x dx + \int_0^1 z \bar{z}_1 dx + (\eta, \eta_1)_{\mathbb{C}^n},$$

with

$$V = \{y \in H^1(0, 1) : y(0) = 0\}.$$

Maximal dissipativity

- Cauchy problem:

$$\dot{u} = \mathcal{A}u, \quad u(0) = u_0, \quad (3)$$

$$D(\mathcal{A}) = \{(y, z, \eta) \in H^2(0, 1) \cap V \times V \times \mathbb{C}^n : y_x(1) = -(\eta, C)_{\mathbb{C}^n}\},$$

and

$$\mathcal{A} \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} = \begin{pmatrix} z \\ y_{xx} \\ B\eta + Cz(1) \end{pmatrix}, \forall \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} \in D(\mathcal{A}).$$

- \mathcal{A} is m-dissipative and

$$\frac{d}{dt} E(t) = \Re(\mathcal{A}U, U) = \Re(B\eta, \eta) \leq 0,$$

using Lummer-Phillips \mathcal{A} generates a C_0 -semigroup.

- \mathcal{A} has a Compact resolvent.

Characteristic equation

- The characteristic equation satisfied by $\lambda \in \sigma(\mathcal{A})$:

$$C_{\mathcal{A}}(\lambda) = \det \begin{pmatrix} \lambda I - B & -C \sinh \lambda \\ C^* M & \cosh \lambda \end{pmatrix} = 0.$$

- Each $\lambda \in \sigma(\mathcal{A}) \setminus \sigma(B)$ satisfies:

$$\cosh \lambda + \left((\lambda I - B)^{-1} C, C \right)_{\mathbb{C}^n} \sinh \lambda = 0, \quad (4)$$

with the associated eigenvector

$$\alpha(\sinh(\lambda x), \lambda \sinh(\lambda x), (\lambda I - B)^{-1} C \lambda \sinh \lambda).$$

Let B^* be the adjoint matrix of B with respect to $(\cdot, \cdot)_{\mathbb{C}^n}$, write

$$B = B_0 + R$$

- $B_0 = \frac{B - B^*}{2}$ skew-adjoint.
- $R = \frac{B + B^*}{2}$ self-adjoint.

Define

- $A \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} = \begin{pmatrix} z \\ y_{xx} \\ B_0\eta + Cz(1) \end{pmatrix}, \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} \in D(A) = D(\mathcal{A})$.
- $P : \mathbb{C}^n \rightarrow W$: the projection map from \mathbb{C}^n onto $W = (\ker R)^\perp$.

Remark:

$$\frac{d}{dt} E(t) = (R\eta, \eta).$$

Let B^* be the adjoint matrix of B with respect to $(\cdot, \cdot)_{\mathbb{C}^n}$, write

$$B = B_0 + R$$

- $B_0 = \frac{B - B^*}{2}$ skew-adjoint.
- $R = \frac{B + B^*}{2}$ self-adjoint.

Define

- $A \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} = \begin{pmatrix} z \\ y_{xx} \\ B_0\eta + Cz(1) \end{pmatrix}, \begin{pmatrix} y \\ z \\ \eta \end{pmatrix} \in D(A) = D(\mathcal{A}).$
- $P : \mathbb{C}^n \rightarrow W$: the projection map from \mathbb{C}^n onto $W = (\ker R)^\perp$.

Remark:

$$\frac{d}{dt} E(t) = (R\eta, \eta).$$

Asymptotic+Non Exp.stability of \mathcal{A}

Suppose

- (A₁) $\sigma(A) \cap \sigma(B_0) \subset \{ik\pi : k \in \mathbb{Z}\}$,
- (A₂) The eigenvector ν_k of B_0 associated with $ik\pi \in \sigma(B_0)$ satisfies $P\nu_k \neq 0$,
- (A₃) $P((i\mu I - B_0)^{-1}C) \neq 0, \forall i\mu \in \sigma(A) \setminus \sigma(B_0)$.

then

- $\sigma(\mathcal{A}) \cap i\mathbb{R} = \emptyset$, hence \mathcal{A} is **asymptotically stable**.
- $P\eta_\mu \neq 0$, for all $i\mu \in \sigma(A)$.

Proposition

The system (3) is not uniformly stable in the energy space \mathcal{H} .

Proof. $(\mathcal{A} - A)(y, z, \eta)^\top = (0, 0, R\eta)^\top$, compact perturbation of a conservative problem.

Decomposition of solution

- Let u be a solution of the original system

$$\begin{cases} \frac{d}{dt}u(t) = Au(t), & t > 0, \\ u(0) = u_0, \end{cases}$$

- Let u_1 be the solution of the conservative problem,

$$\begin{cases} \frac{d}{dt}u_1(t) = Au_1(t), & t > 0, \\ u_1(0) = u_0. \end{cases} \quad (5)$$

- $u_2 = u - u_1$ fulfills

$$\begin{cases} \frac{d}{dt}u_2(t) = Au_2(t) + f(t), & t > 0, \\ u_2(0) = 0, \end{cases}$$

where $f = (0, 0, R\eta)$ with η the last component of u .

Decomposition of solution

- Let u be a solution of the original system

$$\begin{cases} \frac{d}{dt}u(t) &= \mathcal{A}u(t), \quad t > 0, \\ u(0) &= u_0, \end{cases}$$

- Let u_1 be the solution of the conservative problem,

$$\begin{cases} \frac{d}{dt}u_1(t) &= \mathcal{A}u_1(t), \quad t > 0, \\ u_1(0) &= u_0. \end{cases} \tag{5}$$

- $u_2 = u - u_1$ fulfills

$$\begin{cases} \frac{d}{dt}u_2(t) &= \mathcal{A}u_2(t) + f(t), \quad t > 0, \\ u_2(0) &= 0, \end{cases}$$

where $f = (0, 0, R\eta)$ with η the last component of u .

Decomposition of solution

- Let u be a solution of the original system

$$\begin{cases} \frac{d}{dt}u(t) &= \mathcal{A}u(t), \quad t > 0, \\ u(0) &= u_0, \end{cases}$$

- Let u_1 be the solution of the conservative problem,

$$\begin{cases} \frac{d}{dt}u_1(t) &= \mathcal{A}u_1(t), \quad t > 0, \\ u_1(0) &= u_0. \end{cases} \tag{5}$$

- $u_2 = u - u_1$ fulfills

$$\begin{cases} \frac{d}{dt}u_2(t) &= \mathcal{A}u_2(t) + f(t), \quad t > 0, \\ u_2(0) &= 0, \end{cases}$$

where $f = (0, 0, R\eta)$ with η the last component of u .

An a priori estimate+Interpolation inequality

Proposition

For all $T > 0$, there exists $c > 0$ depending on T such that

$$\int_0^T (-R\eta_1(t), \eta_1(t)) dt \leq c \int_0^T (-R\eta(t), \eta(t)) dt. \quad (6)$$

R.T.P

$$E(t) \leq \frac{M}{(1+t)^{\frac{1}{m+1}}} \|u_0\|_{D(\mathcal{A})}^2.$$

Method: A Priori Estimate (6)+ Observability Inequality,

$$E(0) - E(T) = \int_0^T (-R\eta(t), \eta(t)) dt \geq c \|u_0\|_{D(A^{-(m+1)})}^2.$$

Moreover, using

Interpolation inequality: $\|u_0\|_{\mathcal{H}}^{s+1} \leq \|u_0\|_{D(A^{-s})} \|u_0\|_{D(A)}^s$,
 we deduce polynomial stability.

A priori estimate

Proof.

$$\begin{aligned}
 (u_2(t), u_2(t))_{\mathcal{H}} &= \int_0^t \left(e^{A(t-s)} \begin{pmatrix} 0 \\ 0 \\ R\eta(s) \end{pmatrix}, u_2(t) \right)_{\mathcal{H}} ds \\
 &= \int_0^t \left(\begin{pmatrix} 0 \\ 0 \\ R\eta(s) \end{pmatrix}, e^{-A(t-s)} u_2(t) \right)_{\mathcal{H}} ds \\
 &= \int_0^t \left(R\eta(s), p_3(e^{-A(t-s)} u_2(t)) \right)_{\mathbb{C}^n}^2 ds
 \end{aligned}$$

$$\|u_2(t)\|_{\mathcal{H}}^2 \lesssim \left(\int_0^t (-R\eta(s), \eta(s)) ds \right)^{\frac{1}{2}} \left(\int_0^t \|p_3(e^{-A(t-s)} u_2(t))\|_{\mathbb{C}^n}^2 ds \right)^{\frac{1}{2}}.$$

Asymptotic behavior of the spectrum of A

Assume that there exists $p \in \mathbb{N} \cup \{0\}$ such that $P(B_0^p C) \neq 0$. Let

$$m = \min\{p \in \mathbb{N} \cup \{0\} : P(B_0^p C) \neq 0\}. \quad (7)$$

$$\phi_\mu = \frac{1}{\sqrt{N(\mu)}}(i \sin(\mu x), -\mu \sin(\mu x), -(i\mu I - B_0)^{-1} C \mu \sin \mu).$$

The expansions of μ_k (with $\mu_k \in (k\pi, (k+1)\pi)$), $N(\mu_k)$, and $P_{\eta_{\mu_k}}$:

$$\mu_k = k\pi + \frac{\pi}{2} + \frac{\|C\|^2}{k\pi} - \frac{\|C\|^2}{2k^2\pi} + \frac{(B_0 C, C)}{ik^2\pi^2} + o\left(\frac{1}{k^2}\right),$$

$$N(\mu_k) = k^2\pi^2 + o(k^2),$$

$$P_{\eta_{\mu_k}} = (-1)^k \frac{1}{j^{m-1}} \left(\frac{P(B_0^m C)}{k^{m+1}\pi^{m+1}} + o\left(\frac{1}{k^{m+1}}\right) \right).$$

An Observability Inequality

Now we suppose that

all $\lambda \in \sigma(A) \cap \sigma(B_0) \subset \{in\pi : n \in \mathbb{Z}\}$ are simple eigenvalues of B_0 . (8)

Proposition

Assume (7) and (8) and let $u_1 = (y_1, z_1, \eta_1)^T$ be the solution of the conservative problem (5) with initial datum $u_0 \in D(A)$. If A_1, A_2 , and A_3 hold, then there exists $T > 0$ and $c > 0$ depending on T such that

$$\int_0^T \|P\eta_1(t)\|^2 dt \geq c \|u_0\|_{D(A^{-(m+1)})}^2. \quad (9)$$

An Observability Inequality

proof. Since $(\phi_{0,n})_{n \in I}$ is a Hilbert basis of \mathcal{H} , write $u_0 = \sum_{n \in I} u_0^{(n)} \phi_{0,n}$.

$$u_1(t) = \sum_{n \in I} u_0^{(n)} e^{i\mu_n t} \phi_{0,n} \quad P\eta_1(t) = \sum_{n \in I} u_0^{(n)} e^{i\mu_n t} P\eta_1^{(n)}.$$

For $n_0 \in \mathbb{N}$ large enough, $\exists k_{n_0}$ s.t $\forall |n| \geq n_0$, $\mu_n \in [k_n \pi, k_{n+1} \pi]$ with

$$P\eta_1^{(n)} = (-1)^n \frac{1}{i^{m-1}} \left(\frac{P(B_0^m C)}{k_n^{m+1} \pi^{m+1}} + o\left(\frac{1}{k_n^{m+1}}\right) \right)$$

Set $\gamma_0 = \min \left\{ \frac{\pi}{2}, \min \{ \mu_{n+1} - \mu_n : |n| < n_0 \} \right\}$. As $\mu_{k+1} - \mu_k \geq \gamma_0 > 0$, $\exists T > 2\pi\gamma_0 > 0$ and $c(T)$ such that

$$\int_0^T \|P\eta_1(t)\|^2 dt \geq c \sum_{n \in I} \|u_0^{(n)} P\eta_1^{(n)}\|^2. \text{(Ingham's inequality)}$$

$$\int_0^T \|P\eta_1\|^2 dt \gtrsim \sum_{|n| < n_0} |u_0^{(n)}|^2 |\lambda_{0,n}|^{-2(m+1)} + \sum_{|n| \geq n_0} \frac{|u_0^{(n)}|^2}{k_n^{2(m+1)}}.$$

The polynomial stability

Theorem

Let u be a solution of the problem (3) with initial datum $u_0 \in D(\mathcal{A})$. Let the assumptions A_1, A_2, A_3 be satisfied. Assume moreover (8) and the existence of m as defined by equation (7), then we obtain the following polynomial energy decay:

$$E(t) \leq \frac{M}{(1+t)^{\frac{1}{m+1}}} \|u_0\|_{D(\mathcal{A})}^2,$$

for some $M > 0$.

Polynomial stability

Proof. Set $E_1(0) = \frac{1}{2} (\|u_0\|_{\mathcal{H}}^2 + \|Au_0\|_{\mathcal{H}}^2)$. We have

$$E(T) - E(0) = \int_0^T (R\eta, \eta) dt \leq -K \|u_0\|_{D(A^{-(m+1)})}^2.$$

Using $\|u_0\|_{D(A^{-(m+1)})}^2 \geq \frac{\|u_0\|_{\mathcal{H}}^{2(m+2)}}{\|u_0\|_{D(A)}^{2(m+1)}} \geq \frac{E^{m+2}(0)}{E_1^{m+1}(0)}$, we get

$$E((k+1)T) \leq E(kT) - K \frac{E^{m+2}((k+1)T)}{E_1^{m+1}(kT)},$$

dividing by $E_1(0)$,

$$\varepsilon_{k+1} \leq \varepsilon_k - C \varepsilon_{k+1}^{m+2}, \forall k \geq 0,$$

with $\varepsilon_k = \frac{E(kT)}{E_1(0)}$. Hence

$$\varepsilon_k \leq \frac{M}{(1+k)^{\frac{1}{m+1}}}, \forall k \geq 0.$$

Spectrum of \mathcal{A}

- The number of eigenvalues of \mathcal{A} counted with multiplicities is equal to that of A in the square $C_n = [-n\pi, n\pi] \times [-n\pi, n\pi]$, for n large enough.
- All the eigenvalues of \mathcal{A} have finite algebraic multiplicities. Moreover, the eigenvalues with large enough moduli are algebraically simple.

Proposition

Let λ be an eigenvalue of \mathcal{A} with $|\lambda|$ large enough. Then λ satisfies the following expansion for some k large enough,

$$\lambda = i \left(k\pi + \frac{\pi}{2} + \frac{\|C\|^2}{k\pi} - \frac{\|C\|^2}{2k^2\pi} + \frac{(B_0 C, C)}{ik^2\pi^2} \right) + \frac{(RC, C)}{k^2\pi^2} + o\left(\frac{1}{k^2}\right). \quad (10)$$

Optimality of the energy decay rate

Proposition

Assume that

$$\sigma(A) \cap \sigma(B_0) \subseteq \{ik\pi : k \in \mathbb{Z}\} \text{ and } \sigma(A) \cap \sigma(B) = \emptyset, \quad (11)$$

then the system of generalized eigenvectors of A forms a Riesz basis of \mathcal{H} .

Define

$$\omega(u_0) = \sup\{\alpha \in \mathbb{R} : E(t) = \frac{1}{2}\|u(t)\|^2 \lesssim \frac{1}{t^\alpha}\}.$$

Optimality of the energy decay rate

Proposition

If $\Re(\lambda_k) \sim -\frac{1}{k^\delta}$, with $\delta \geq 2(m+1)$, then

$$\inf_{u_0 \in D(\mathcal{A})} \omega(u_0) = \frac{1}{m+1}.$$

- If $m = 0$ we obtain optimal polynomial energy decay given by $E(t) \leq \frac{c}{t} \|\mathcal{A}u_0\|_{\mathcal{H}}^2$.
- If $m = 1$, $(RC, C) = 0$, and $\Im(B^2C, C) = 0$ then the polynomial energy decay rate is optimal.

Example

Consider

$$\begin{cases} y_{tt}(x, t) - y_{xx}(x, t) &= 0, \quad 0 < x < 1, t > 0, \\ y(0, t) &= 0, \quad t > 0, \\ y_x(1, t) + \eta_t(t) &= 0, \quad t > 0, \\ \eta_{tt}(t) + b_1\eta_t(t) + b_0\eta(t) - y_t(1, t) &= 0, \quad t > 0, \end{cases}$$

$$n = 2, \quad B = \begin{pmatrix} 0 & 1 \\ -b_0 & -b_1 \end{pmatrix} \text{ and } C = \begin{pmatrix} 0 \\ 1 \end{pmatrix}.$$

Example

$$\left(\begin{pmatrix} x \\ y \end{pmatrix}, \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} \right)_{\mathbb{C}^2} = b_0 x \bar{x}_1 + y \bar{y}_1, \text{ or } M = \begin{pmatrix} b_0 & 0 \\ 0 & 1 \end{pmatrix},$$

$$B^* = \begin{pmatrix} 0 & -1 \\ b_0 & -b_1 \end{pmatrix}, B_0 = \begin{pmatrix} 0 & 1 \\ -b_0 & 0 \end{pmatrix}, R = \begin{pmatrix} 0 & 0 \\ 0 & -b_1 \end{pmatrix}.$$

$$P((\lambda I - B_0)^{-1} C) \neq 0, \forall \lambda \in \sigma(A) \setminus \sigma(B_0).$$

Example

- If $\mu^2 = b_0 \neq k^2\pi^2$ for all $k \in \mathbb{Z}$, then

$$C \notin \ker(i\mu I - B_0)^\perp.$$

Indeed, computing

$$\left(\begin{pmatrix} 1 \\ i\mu \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \end{pmatrix} \right) = i\mu \neq 0,$$

thus $\sigma(A) \cap \sigma(B_0) = \emptyset$.

- If $b_0 = k^2\pi^2$ for some $k \in \mathbb{N}^*$, then $\sigma(B_0) = \{\pm ik\pi\}$. Computing the associated eigenvectors we get

$$\eta_{\pm k\pi} = \begin{pmatrix} 1 \\ \pm ik\pi \end{pmatrix} \text{ and } P(\eta_{\pm k\pi}) = \begin{pmatrix} 0 \\ \pm ik\pi \end{pmatrix} \neq 0.$$

Example

- As $m = 0$ (since $PC \neq 0$), the system satisfies the following **optimal** polynomial decay

$$E(t) \leq \frac{1}{1+t} \|u_0\|_{D(\mathcal{A})}^2.$$

- Suppose that for the same B we choose the system with $C = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$, then we obtain $\frac{1}{2}$ as an optimal polynomial decay rate.
