Virtual NLO Contributions

Self-Energy Corrections

Dimensional Schemes

Comparison with FDH (Dimensional Reduction Scheme)

Conclusions

- Non-Dimensional framework
- it deals with UV divergences through a minimal-subtraction equivalent scheme.
- It is compatible with the BPHZ theorem, assuring locality, causality and Lorentz invariance. ^{4 5}
- It complies with Abelian gauge symmetry at arbitrary loop level. ^{6 7}

Rules for IReg: Some Remarks

Renormalization scale

A renormalization group scale can be introduced by disentangling the UV/IR behavior of BDI's under the limit $\mu \rightarrow 0$. This is achieved by employing the identity

$$I_{\log}(\mu^2) = I_{\log}(\lambda^2) + b \cdot \ln\left(\frac{\lambda^2}{\mu^2}\right), \quad b = \frac{i}{(4\pi)^2}$$

Renormalization scale

A renormalization group scale can be introduced by disentangling the UV/IR behavior of BDI's under the limit $\mu \rightarrow 0$. This is achieved by employing the identity

$$I_{\log}(\mu^2) = I_{\log}(\lambda^2) + b \cdot \ln\left(\frac{\lambda^2}{\mu^2}\right), \quad b = \frac{i}{(4\pi)^2}$$

It is possible to absorb the BDI's in the renormalization constants (without explicit evaluation), and renormalization functions can be readily computed using

$$\lambda^2 \frac{\partial I_{\log}(\lambda^2)}{\partial \lambda^2} = -b$$

The Right(left)-most-position

similar to the T'Hooft-Veltman scheme, we also employ the right(left)-most-position method ^a ^b. The appearing γ^5 are moved all the way to the right(left)-most-position before performing the Dirac algebra.

Conclusions

- The Z_0 decay is a prototype for Chiral Theories
- For a more complete model we also study the decay of a general Scalar and Pseudo-Scalar
- At the Energy Scale of Z_0 the strong coupling becomes weak ⁹

Dimensional Schemes

Comparison with FDH (Dimensional Reduction Scheme)

Conclusions

Dimensional Regularization Schemes

(HV) 't Hooft-Veltman: Internal Vectors are treated in D-dimension, External Vectors are strictly 4-dimensional.

(CDR) Conventional Dimensional Regularization: Both internal and External Vectors are treated in D-dimension.

Dimensional Reduction Schemes

(DREG) Dimensional Reduction: Both internal and External Vectors are quasi-4-dimensional.

(FDH) Four Dimensional Helicity: Only The Internal Vectors are Treated in the quasi-4-dimensional space, External Vectors are strictly 4-dimensional.

Considerations of DS: Evanescent Fields in Dimensional Reductions schemes ¹³

$$d_s = d + n_\epsilon = 4 - 2\epsilon + n_\epsilon$$

QED

$$D_{[d_s]}^\mu \psi_i = \partial_{[d]}^\mu \psi_i + i \left(e A_{[d]}^\mu + e_e A_{[n_\epsilon]}^\mu \right) Q \psi_i$$

QCD

$$D_{[d_s]}^\mu \psi_i = \partial_{[d]}^\mu \psi_i + i \left(g_s A_{k[d]}^\mu + g_e A_{k[n_\epsilon]}^\mu \right) T^{ijk} \psi_j$$

- In this work we have verified that the KLN theorem is satisfied in our framework.¹⁶
- It is not necessary to introduce evanescent particles, unlike in partially dimensional methods such as FDH and DRED.
- We also compared IReg with these methods, showing that, regarding IR divergences, there is a precise matching rule between IReg and dimensional results at NLO.
- γ_5 right-most-position approach is sufficient to render IReg a gauge invariant procedure in this case while reproducing the results obtained with more involved schemes literature.
